

Loading Effects

With V4.1 of Ethos, the loading of stitch effects has now been made more graphical. Stitch effect can be loaded using the stitch effect editor by pressing the Load button on the main form. For V4.1 the old style file dialog has now been replaced by a new graphical interface as shown below.

The drop down list shows all the libraries available. Selecting one of these will cause the system to refresh the right hand panel with the effect thumbnails (this may take a few seconds). To bring an effect in from a library to your current design simply click on and drag over the thumbnail from the right hand panel to the left hand panel. The effect will then appear by name in the effect list when punching.

Pressing will delete a chosen effect (be careful when using this).

A single click on the effect name will allow you to rename an effect, which may also be necessary if you try to load an effect which already exists in the design (2 different effect using the same name).

V4.10 is now supplied with a standard set of effect libraries

- Full Step – these are various solid fill patterns (standard density).
- Open Step – these are loose fill patterns.
- Running – various running effects.
- Satin – various satin effects.
