

Inserting USB Hub to 3.0 USB Ports

When a large print file is sent to the printer via a 3.0 USB port, it is possible that the PC will not recognize the printer and the file will not be uploaded to the printer successfully. This type of USB port is very common on computers using Windows 8.0 and 8.1 operating systems. To remedy this situation a USB hub should be used.

Insert the Hub cable into the 3.0 USB port of the PC and connect the printer USB cable to the USB Hub. Send designs to the printer as usual.
